1.1 Definitions and basic properties of polynomial

\mathbb{N} = set of natural number

$\mathbb{N}_0 = \mathbb{N} \cup \{0\}$

for $n \in \mathbb{N}$, $\mathbb{N}_0^n = \{\alpha = (\alpha_1, \dots, \alpha_n) | \alpha_1, \dots, \alpha_n \in \mathbb{N}_0\}$ (is semi-module because closed over addition)

$0 = (0, \dots, 0)$ and x_1, \dots, x_n ; variables

for $\alpha = (\alpha_1, \dots, \alpha_n) \in \mathbb{N}_0^n$

a monomial (or direct product of variables) $x^\alpha = \begin{cases} 1 & , (\text{if } \alpha = 0) \\ x_1^{\alpha_1} x_2^{\alpha_2} \dots x_n^{\alpha_n} & , (\text{otherwise}) \end{cases}$

K is **field**. [Field : is a set on which addition, subtraction, multiplication, and division are defined, and behave as when they are applied to rational and real numbers.-wikipedia]

Definition 1. Let $A \subset \mathbb{N}_0^n$: finite

$$f = \sum_{\alpha \in A} c_\alpha x^\alpha \quad (c_\alpha \in K)$$

is called **a polynomial** of x_1, \dots, x_n with K -coefficients. It also can be written as

$$K[x] = K[x_1, \dots, x_n] = \{f | f \text{ is a polynomial of } x_1, \dots, x_n \text{ with } K\text{-coefficients}\}.$$

$$M_n = \{x^\alpha | \alpha \in \mathbb{N}_0^n\} \subset K[x]$$

Example 1. $n = 2$ then we have $A = \{(0, 0), (1, 1), (0, 3), (2, 0), (2, 1)\}$.

$$\text{For } f = x_1^2 x_2 + 5x_2^3 - 2x_1 x_2 + 10,$$

we can obtain $C_{(2,1)} = 1, C_{(2,0)} = 0, C_{(0,3)} = 5, C_{(1,1)} = -2, C_{(0,0)} = 10$.

Definition 2. Support. $f = \sum_{\alpha \in A} c_\alpha x^\alpha \neq 0$ then

$$\text{supp}(f) = \{\alpha \in A | C_\alpha \neq 0\}$$

Example 2. $\text{supp}(f) = \{(0, 0), (1, 1), (0, 3), (2, 1)\}$

Definition 3. Total degree. $|\alpha| = \alpha_1 + \dots + \alpha_n, (\alpha \in (\mathbb{N}_0^n))$. If $\text{supp}(f) \neq \emptyset$

$$\text{tdeg}(f) = \max\{|\alpha| \mid \alpha \in \text{supp}(f)\}$$

Example 3. $\text{tdeg}(f) = \max\{0, 2, 3, 3\} = 3$

$$f, g \in K[x]$$

f g or associated $\Leftrightarrow \exists C \in K \setminus \{0\}$ such that $f = c \cdot g$.

For example : $f = x_1^2 x_2 + 1; g = 3x_1^2 x_2 + 3; h = 3x_1^2 x_2 + 2$. Then f g , f not h

$$f|g \text{ or } f \text{ divides } g \Leftrightarrow \exists h \in K[x] \text{ such that } f \cdot h = g$$

Properties 1. $f|g \Rightarrow \text{tdeg}(f) \leq \text{tdeg}(g)$

Definition 4. Let $f \in K[x]$ K . f is **irreducible** if $(h|f \Rightarrow (h \in K \text{ or } h = f))$. If $\text{tdeg}(f) > 0$ and f is not irreducible, then f is called **reducible**.

Theorem 1. Let $f \in K[x]$ K . Then f can be **factorized** as

1. $f = c g_1^{\beta_1} g_2^{\beta_2} \dots g_m^{\beta_m}$ where $c \in K \setminus \{0\}$, $\beta_1, \beta_2, \dots, \beta_m \in \mathbb{N}$, and g_1, \dots, g_m : irreducible, g_i not g_j ($i \neq j$)

2. if $f = c g_1^{\beta_1} g_2^{\beta_2} \dots g_m^{\beta_m} = d h_1^{\gamma_1} h_2^{\gamma_2} \dots h_l^{\gamma_l}$ (factorization). Then (a) $m = l$, (b) by change of index, $g_1 h_1, \dots, g_m h_m$.

We can define $GCD(f, g)$ for $f, g \in K[x]$, $((f, g) \neq (0, 0))$

Definition 5. Let $I \in K[x]$, $I \neq \emptyset$. I is **an ideal** if

$$1. f, g \in I \Rightarrow f + g \in I$$

$$2. f \in I, r \in K[x] \Rightarrow r \cdot f \in I$$

Definition 6. An ideal generated by f_1, \dots, f_m . Let $f_1, \dots, f_m \in K[x] \setminus \{0\}$

$$\langle f_1, \dots, f_m \rangle = \{r_1 f_1 + r_2 f_2 + \dots + r_m f_m | r_1, r_2, \dots, r_m \in K[x]\}$$

Properties 2. $\langle f_1, \dots, f_m \rangle$ is an ideal.

Properties 3. $0 \in I$ (an ideal)

Problem : Ideal membership problem. Given $I = \langle f_1, \dots, f_m \rangle$ and a polynomial h . Determine $h \in I$ or not !

1.2 Single Variable

Take $n = 1, x = x_1, K[x] = K[x_1]$. For $f \in K[x]$ we define **degree of f** as

$$\deg(f) = \begin{cases} \deg(f), & (f \neq 0) \\ -\infty, & (f = 0) \end{cases}$$

We define this such that properties below is satisfied.

Properties 4. Let $f, g \in K[x]$.

1. $\deg(f + g) \leq \max\{\deg(f), \deg(g)\}$
2. $\deg(fg) = \deg(f) + \deg(g)$

Example 4. 1. $f = 2x^2 + 1, g = x + 1$

2. $f = x + 1, g = -x$

3. $f = x + 1, g = 0$

Theorem 2. Division Principle. Let $f, g \in K[x]$ and $g \neq 0$. Then there exist unique polynomials q, r such that

$$f = q \cdot g + r$$

and $\deg(r) < \deg(g)$ where q is **quotient** and r is **remainder**.

Example 5. $f = x^3 + x - 1, g = 2x^2 - 1$. Then $f = x^3 + x - 1 = \frac{1}{2}x(2x^2 - 1) + \frac{3}{2}x - 1$ with $\deg(g) = 2, \deg(r) = 1$
