1 09-04-2018

We will learn about : Basics of functions of several variables. In this lecture:

1.1 A sequence in the Euclidean space and its application

Using these notation :

- $\mathbb{N}$: set of natural number ($\mathbb{N} = \{1, 2, 3, \dots\}$)
- $\mathbb{Z}$: set of integers ($\mathbb{Z} = \{0, \pm 1, \pm 2, \dots\}$)
- $\mathbb{Q}$: set of rational number ($\mathbb{Q} = \{0, \pm 1, \pm 2, \frac{2}{3}, \dots\}$)
- $\mathbb{R}$: set of real number
- $\mathbb{C}$: set of complex number

Definition 1. *A sequence $(x_n)_{n=1}^{\infty}$ is an assignment of (real) number $x_n \in \mathbb{R}$ to natural number $n \in \mathbb{N}$ ($x_n \in \mathbb{R}$).*
Example : $x_n = \frac{1}{n}$. $x_1 = 1, x_2 = \frac{1}{2}, \dots$

Definition 2. *A subsequence of a sequence $(x_n)_{n=1}^{\infty}$ is a sequence $(y_j)_{j=1}^{\infty}$ defined by $y_j = x_{n_j}$ for some sequence $(n_j)_{j=1}^{\infty}$ in $\mathbb{N}$ such that $n_j < n_{j+1}$ $(j = 1, 2, \dots)$.*
Example : sequence $(x_n)_{n=1}^{\infty} = 1, \frac{1}{2}, \frac{1}{3}, \dots, \frac{1}{100}$, takes $n_1 = 1, n_2 = 3, n_3 = 5, n_4 = 100$
subsequence $(x_{n_j})_{j=1}^{\infty} = x_{n_1}, x_{n_2}, x_{n_3}, x_{n_4} = 1, \frac{1}{3}, \frac{1}{5}, \frac{1}{100}$.

Definition 3. *Let $(x_n)_{n=1}^{\infty}$ be a sequence converges to $\alpha \in \mathbb{R}$ if for any $\epsilon > 0$, there is an $N \in \mathbb{N}$ such that $n > N$, $|x_n - \alpha| < \epsilon$.*
In the mathematical symbol $\forall \epsilon > 0, \exists N \in \mathbb{N}$ such that $n > N$, $|x_n - \alpha| < \epsilon$ for $n > N$.
In this case we write, $\lim\limits_{n \to \infty}$ or $x_n \to \alpha$ $(n \to \infty)$

Example 1.

Theorem 1. *$(x_n)_{n=1}^{\infty}, (y_n)_{n=1}^{\infty}$ is sequence. Suppose $x_n \to \alpha$ and $y_n \to \beta$ as $n \to \infty$.*

1. *$x_n \pm y_n \to \alpha \pm \beta$, $(n \to \infty)$*
2. *$x_n \cdot y_n \to \alpha \cdot \beta$, $(n \to \infty)$*
3. *if $\beta \neq 0$, $\frac{x_n}{y_n} \to \frac{\alpha}{\beta}$, $(n \to \infty)$*

Remark 1. *On 3, $\frac{x_n}{y_n}$ is not defined for all $n \in \mathbb{N}$ because $y_n = 0$ possibly for some $n \in \mathbb{N}$. But, since $y_n \to \beta \neq 0$, y_n eventually is not 0. Hence $\frac{x_n}{y_n}$ is defined eventually.*

Theorem 2. *$(x_n)_{n=1}^{\infty}$ a sequence. If $(x_n)_{n=1}^{\infty}$ converges to $\alpha \in \mathbb{R}$, any subsequence of (x_n)*

2 16-04-2018

2.1 n-dimensional space

$\mathbb{R}^2 = \mathbb{R} \times \mathbb{R} \times \cdots \times \mathbb{R} = \{(x_1, \dots, x_n) | x_i \in \mathbb{R}\}$.
Takes $n = 2$, $\mathbb{R}^2 \Leftrightarrow$ plane, we have $P(a, b)$.
For $n = 3$, we have $P(a, b, c)$.

Definition 4. *$P_m = (x_1^m, \dots, x_n^m) \in \mathbb{R}^n$, and $\{P_m\}_{m=1}^{\infty}$: a sequence in $\mathbb{R}^n$.*
$\{P_m\}$ converges to $A = (a_1, \dots, a_n) \in \mathbb{R}^n$, if $\forall k = 1, \dots, n$, $x_k^m \to a_k$ as $n \to \infty$.

Definition 5. ***Inner product and norm.***
$\mathbf{x} = (x_1, \dots, x_n), \mathbf{y} = (y_1, \dots, y_n) \in \mathbb{R}^n$. We can define :
*$\mathbf{x} \cdot \mathbf{y} = x_1 y_1 + \cdots + x_n y_n$; **inner product***
*$\| \mathbf{x} \| = \sqrt{\mathbf{x} \cdot \mathbf{x}}$; **norm***

Example 2. $\mathbf{x} \cdot \mathbf{y} = 0 \Leftrightarrow \mathbf{x}$ *is perpendicular to* $\mathbf{y}$
Takes $n = 0$ *then*

$$\begin{aligned} x_1y_1 + x_2y_2 &= 0 \\ x_1y_1 &= -x_2y_2 \\ \frac{y_1}{y_2} &= -\frac{x_2}{x_1} \\ \text{then } (x_1, x_2) = c \cdot (-y_2, y_1) \end{aligned}$$

pict :

Example 3. $\| \mathbf{x} \| = 0 \Leftrightarrow x = 0$
$(\Rightarrow)$ $0 = \| x \|^2 = x_1^2 + \cdots + x_n^2$, *then* $x_1^2 = 0$ $(\forall i = 1, \ldots, n)$ *and finally* $x_1 = 0$.

Notes 1. $\| x \|$ *is the distance between* $\mathbf{0} = (0, \ldots, 0) \in \mathbb{R}^n$ *and* $\mathbf{x} = (x_1, \ldots, x_n)$.
For notation, we will use $P, Q \in \mathbb{R}^n$ *as points and* $\mathbf{x}, \mathbf{y} \in \mathbb{R}^n$ *as vectors.*
We also use $\| x - y \| = \sqrt{(x_1 - y_1)^2 + \cdots + (x_n - y_n)^2}$ *as distance between* $\mathbf{x}$ *and* $\mathbf{y}$.
$\| P - Q \|$ *is distance between* P *and* Q.

$$\mathbf{x} \pm \mathbf{y} = (x_1 \pm y_1, \ldots, x_n \pm y_n)$$

$$P = (p_1, \ldots, p_n), Q = (q_1, \ldots, q_n), \text{ then } P + Q = (p_1 + q_1, \ldots, p_n + q_n)$$

$$\alpha \in \mathbb{R}, \ \alpha\mathbf{x} = (\alpha x_1, \ldots, \alpha x_n), \alpha P = (\alpha p_1, \ldots, \alpha p_n)$$

$$\{P_m\}_{m=1}^{\infty} : \text{a sequence in } \mathbb{R}^n, \ P_m \to A \Leftrightarrow \| P_m - A \| \to 0$$

Theorem 3. ***Cauchy-Schwarz inequality***. *For any* $\mathbf{x}, \mathbf{y} \in \mathbb{R}^n$,

$$| \mathbf{x} \cdot \mathbf{y} | \leq \| x \| \| y \|$$

"=" $\Rightarrow a\mathbf{y} = b\mathbf{x}$ *for some* $a, b \in \mathbb{R}$.
$\therefore$ *We may assume* $\mathbf{x} \neq 0, \forall t \in \mathbb{R}$.

$$0 \leq ||t\mathbf{x} + \mathbf{y} = t^2||\mathbf{x}||^2 + 2t(\mathbf{x} \cdot \mathbf{y}) + ||\mathbf{y}||^2$$

$$D/4 \leq 0$$

Theorem 4. ***Bolzano=Weierstrass***. *Let* $(P_m)_{m=1}^{\infty} \subset \mathbb{R}^n$ *be a sequence. Suppose that* $(P_m)_{m=1}^{\infty}$ *is bounded. In the sense that* $||P_m|| \leq M (m \in \mathbb{N})$ *for some* $M \geq 0$. *Then* $(P_m)_{m=1}^{\infty}$ *contains a convergent subsequence.*

Definition 6. ***Ball***. $A \in \mathbb{R}^n, R > 0$

$$\mathbf{B}(A, R) = \{P \in \mathbb{R}^n | ||P - A|| < R\}; \text{ open ball of center } A \text{ with radius } R$$

$$\bar{\mathbf{B}}(A, R) = \{P \in \mathbb{R}^n | ||P - A|| \leq R\}; \text{ closed ball}$$

Definition 7.

1. $E \subset \mathbb{R}^n$ *is said to be* ***an open set*** *if* $E = \emptyset$ *or* $\forall A \in E, \exists R > 0$ *such that* $\mathbf{B}(A, R) \subset E$.
2. $E \subset \mathbb{R}^n$ *is said to be* ***a closed set*** *if* $E^c = \mathbb{R}^n \ E$ *is an open set.*
   E : *open, then neighbor in any point*

Definition 8. ***Accumulation point***. $E \subset \mathbb{R}^n$; *a set.* $A \in \mathbb{R}^n$ *is called* ***an accumulation point*** *of* E *if* $\forall R > 0, (\mathbf{B}(A, R) - \{A\}) irisan\ E \neq \emptyset$.

Remark 2. *ini notes.* $E \subset \mathbb{R}^n$ *is closed if and only id* E *contains any accumulation point of* E . ***Homework report, prove this***

Remark 3. *note juga.*

1. *Both* $\emptyset$ *and* $\mathbb{R}^n$ *are open and closed*
2. $\{E_\lambda \lambda \in A\}$; *a collection of open sets* $\Rightarrow$ *union* $\lambda \in AE_\lambda$ *is also open*
3. $\{E_\lambda\}_{\lambda=1}^N$, *a finite collection of open sets* $\Rightarrow$ *irisan* ${}_{lamda=1}^{N} E_\lambda$ *is also open.*
4. ***Rephrase of Bolzano Weierstrass theorem***. $E \subset \mathbb{R}^n$; *a* ***ounded closed set*** $\Leftrightarrow$ E *is a closed set such that* $E \subset \mathbf{B}(\not{F}, R)$ *for some* $R > 0$. E ; *a bounded closed set then any sequence of* E *contains a convergent subsequence whose limit is in* E.

Definition 9. *A bounded closed set in* $\mathbb{R}^n$ *is called* ***compact***.

Example 4. $\bar{\mathbf{B}}(A, R)$ *is compact.* ***Report! prove this***

2.2 Continuity and differentiability of a function

2.2.1 Continuity

E : a set in $\mathbb{R}^n$ and f : is a function of E (real valued function). i.e. f is an assignment a (real) number to a point in E.

Definition 10. *1. f is **continuous at** $A \in E$ if $\forall (P_m)_{m=1}^{\infty} \subset E$: sequence with $P_m \to A$ $(m \to \infty)$*

$$f(P_m) \to f(A) \ (m \to \infty)$$

*2. f is **continuous on E** if f is continuous at any point of E.*

2.2.2 Basic of continuous function on an interval in $\mathbb{R}$

Theorem 5. ***Intermediate value theorem**. f : function on a closed interval $[a, b] = \{x \in \mathbb{R} | a \leq x \leq b\}$. Suppose that $f(a) \leq f(b)$. Then, $\forall \gamma$ with $f(a) \leq \gamma \leq f(b)$, $\exists c \in [a, b]$ with $f(c) = \gamma$.*

Theorem 6. ***Extreme value theorem**. f is a continuous function*
